STRATEGIC BUSINESS MODEL

DePIN Disruption Architecture

Enterprise-grade sovereign storage at Web2-commodity pricing.

Document INAYA-EXEC-2026-V2 · Classification Confidential · August 2026

SECTION 01

Executive Overview

THE MARKET FRICTION

Traditional cloud enforces unpredictable pricing, volatile egress fees, and opaque storage policies.

THE INAYA SOLUTION

A DePIN infrastructure offering sovereign data control, client-side encryption, and binary sharding anchored on BNB Chain.

> Retaining pure stablecoin payment simplicity for consumer onboarding, while structurally driving token demand and ecosystem liquidity.

SECTION 02

Pay-As-You-Go Pricing

- Billed in stablecoin (USDT), no multi-token friction for developers and retail users.
- Rates are read live from the deployed contract — [VERIFY] any specific figure before publishing it, since rates are designed to move.
- Staking $INAYA unlocks priority bandwidth routing.

PROVIDER	STORAGE (1TB/MO)	EGRESS (1TB)	MIN. DURATION
Amazon S3 (Standard)	~23.00 USDT	~90.00 USDT	30 days
Google Cloud Storage	~20.00 USDT	~80.00 USDT	30 days
Legacy Web2 (B2)	~6.00 USDT	~10.00 USDT	None
Inaya Network (DePIN)	[VERIFY current rate]	[VERIFY current rate]	Zero constraints

Competitor pricing above is indicative market reference, not re-verified for this edition. Inaya's own column is intentionally left as [VERIFY] rather than restating a specific figure this document can't confirm is still live.

SECTION 03

Corporate Reserve Plans (Annual)

ALLOCATION	INAYA FEE (USDT/YR)	ANNUAL MAINTENANCE
250 TB / Year	13,500	500 USDT-eq.
500 TB / Year	27,000	1,000 USDT-eq.
1000 TB / Year	54,000	2,000 USDT-eq.

> This is the real, live tier structure in the dApp's Business Model tab and checkout flow.

SECTION 04

Revenue Flow

1. **1. Customer pays.** A corporate or retail customer settles a storage invoice in USDT.
2. **2. Router processes.** RevenueRouter.processCorporateInvoice() executes on-chain.
3. **3. Escrow funds operators.** A separate client-initiated transaction calls InayaCorporateEscrow.createEscrow(), locking the node-operator COGS share for a 12-month, monthly-release vesting schedule.

> **Correction from prior edition.** This is two client-initiated transactions, not one atomic router-to-escrow cascade — corrected against the actual checkout code (page.js's handleCorporateCheckout). [VERIFY] the specific revenue-split percentage between node operators/treasury/team with the founders; RevenueRouter's source isn't tracked in this repo.

SECTION 05

The Staking Flywheel

STAKING MULTIPLIER LOOP

Node operators locking earned rewards back into staking generate a secondary passive income stream instead of immediately liquidating.

REDUCED SELL PRESSURE

As operators favor accumulation over liquidation, circulating supply available for sale drops, while ongoing egress-fee demand continues absorbing it.

> Real, implemented mechanic: InayaStaking offers 0/30/90-day lock tiers at 1.00x/1.25x/1.50x reward multipliers, enforced on-chain via a real withdrawal lock, not just a UI label.

SECTION 06

Token Allocation

SECTOR	%	TOKENS
Swarm Reserve (Nodes)	40.0%	12,000,000 INAYA
Staking Rewards Pool	26.7%	8,000,000 INAYA
Liquidity Pool	21.7%	6,500,000 INAYA
Team Runway	5.0%	1,500,000 INAYA
Core Ecosystem Fund	3.3%	1,000,000 INAYA

> [VERIFY] against the founders before external distribution — $INAYA's own Solidity source isn't tracked in this repository, only its deployed address.

SECTION 07

Foundation Scholarship

- [VERIFY] Total commitment percentage of protocol revenue and per-recipient grant range before publishing specific figures.
- Non-dilutive, objective-focused micro-grants for young developers, cryptography students, and independent open-source builders using the Inaya Custody SDK.
- Not yet accepting applications as of this writing — planned to open after mainnet launch.

SECTION 08

Beyond Storage — The Full Ecosystem

This deck covers the core storage/DePIN economics specifically. Inaya has since grown a full application layer on the same infrastructure — Business Workspace (a genuinely independent SaaS revenue line), the Security Layer, Inaya Learn, an Investor Data Room, two desktop apps, and three AI assistants.

> See the companion "Complete Ecosystem Architecture" and "SaaS Business Model" documents for full detail on the application layer's own economics.

SECTION 09

Leadership

Talha Waqas — Founder & CTO

Web3 full-stack engineer specializing in client-side cryptographic infrastructure and secure data-routing pipelines.

Yakub Adnan — Co-Founder & Growth Lead

Drives growth architecture, community operations, and campaign distribution across the ecosystem.

Fibha Urooj — CFO

Leads financial planning, budgeting, compliance, and operational finance.
