
SIMPLE, CLEAR & EASY-TO-UNDERSTAND GUIDE

INAYA NETWORK

General User & Community FAQs

A FRIENDLY GUIDE FOR EVERYDAY USERS & BUILDERS
INAYA NETWORK — DEPIN INFRASTRUCTURE & CUSTODY PROTOCOL

INAYA-FAQ-COMMUNITY-V2 · Corrected & Updated

Q1

What is Inaya Network in simple terms?

Think of Inaya Network as a private, encrypted vault for your most sensitive files — things like identity documents, private keys, or digital assets. Unlike Google Drive or Dropbox, which store your files whole on central corporate servers, Inaya encrypts your data on your own device first, then splits it into pieces before anything ever leaves your browser. That means no single company, and not even Inaya itself, ever holds a complete, readable copy of your file. No cryptographic or security system can honestly promise to be unbreakable — but this architecture is specifically designed so there's no single point where a complete, readable copy of your data ever exists outside your own control.

Q2

How does the "file slicing" feature actually protect me?

The magic happens entirely inside your own browser before anything is uploaded. When you upload a file, Inaya immediately encrypts it with AES-256-GCM, then splits the encrypted result into two independent pieces: Shard Alpha and Shard Beta, cut at the exact binary midpoint. Each shard is pinned to decentralized storage independently. On its own, either shard alone is meaningless — just encrypted binary noise, unreadable and unusable without the other half. Your file can only be reconstructed and decrypted when you provide your private master passkey, which never leaves your device.

Q3

Do I need to pay a monthly corporate subscription to use Inaya?

Not at all. Monthly subscriptions are for large enterprise customers with predictable, high-volume storage needs — that's what our separate Corporate Reserve plans are for. For everyday users and independent creators, Inaya uses a transparent Pay-As-You-Go model: you only pay for the exact amount of data you actually store, with zero monthly commitment.

Q4

Exactly how much does it cost to store data on Inaya?

Our current live testnet rate is approximately 0.0044 USDT per Gigabyte (GB) of data stored — a small, usage-based fee that covers the physical node network handling your file. Storage ingress currently has no required \$INAYA fee: \$INAYA's utility in the protocol centers on staking,

governance, and egress (retrieval) rather than the upload fee itself. Rates are read live from the deployed contract and may be adjusted by the protocol over time — always confirm the current rate in the app before uploading at scale.

Q5

What crypto wallets are supported by the platform?

Inaya is built natively on the BNB Chain ecosystem. On the web app, you can connect using any standard Web3 browser extension wallet, such as MetaMask. On the Android mobile app, wallet connection currently works specifically through MetaMask, connected directly via deep link. There are no usernames or passwords stored by Inaya — your wallet is your identity.

Q6

I am a student / young developer. How can I get support from Inaya?

We're planning The Inaya Foundation Scholarship & Grant Project — equity-free micro-grants ranging from \$2,500 to \$10,000 for young developers and cryptography students building with the Inaya Custody SDK. This program is funded from the protocol's existing Ecosystem Fund allocation and will open for applications after mainnet launch. It is not yet accepting applications — follow our official channels for the announcement once the application portal goes live.
