INAYA SAAS — BUSINESS MODEL

Business Workspace: The SaaS Engine

A zero-knowledge, encrypted business collaboration platform — built on the same client-side encryption and decentralized storage infrastructure as Inaya's DePIN network, packaged as a recurring-revenue SaaS product for companies of every size.

Document INAYA-SAAS-BM-2026-V1 · Classification Confidential · October 2026

SECTION 01

Executive Overview

Inaya Network operates two complementary engines. The Web3/DePIN engine turns users into node operators and storage demand into on-chain network activity. The Business SaaS engine — Business Workspace — turns that same zero-knowledge storage infrastructure into a recurring-revenue product for companies: document management, team collaboration, and an AI business assistant, all encrypted client-side before it ever reaches a server.

Business Workspace is not a hypothetical roadmap item. Company/department/project/document hierarchy, role-based permissions, secure sharing, a full document approval workflow, and a permission-aware AI assistant are built and live today. This document covers that product specifically: what it does, who it's for, how it's priced, and how it generates revenue.

It's one of several products now built on Inaya's infrastructure alongside the core DePIN storage layer — a decentralized Security Layer, an Oracle & Automation Layer, Inaya Learn, an Investor Data Room, and two desktop apps — each covered in its own dedicated document; this one stays scoped to Business Workspace specifically.

SECTION 02

The Problem

Small and mid-sized businesses face the same structural cloud problems enterprises do, with fewer resources to work around them.

- Provider-managed encryption. Most business cloud storage is encrypted with keys the provider holds, not the customer — meaning the provider technically can access customer data, whether prompted by an internal breach, a compromised employee, or a legal request.
- Egress-driven lock-in. Cheap-to-enter, expensive-to-leave pricing structures make switching providers costly enough that businesses stay even when a better option exists.
- Fragmented tooling. Document storage, approvals, permissions, and team communication typically live in separate, loosely-integrated tools, each with its own access model to manage and audit.
- AI without data-ownership guarantees. As AI assistants increasingly read and act on company documents, businesses have no cryptographic guarantee that a provider (or a provider's AI training pipeline) can't access what's stored.

SECTION 03

The Solution — Business Workspace

STRUCTURED BY DESIGN

Every company using Business Workspace organizes its documents in a real hierarchy — Company → Department → Project → Document — not a flat file dump. Role-based membership (owner, admin, member) governs who can see what, enforced server-side on every request.

WORKFLOW, NOT JUST STORAGE

Documents move through real states — draft, under review, approved, rejected, archived — with a full activity log. Approvals are a first-class feature, not a spreadsheet bolted on afterward.

PERMISSION-AWARE AI

The built-in AI Business Assistant only ever operates over documents the asking user already has access to — permission scoping happens before the model sees anything, not as a prompt-level instruction the model could ignore.

Also included: secure, expiring document share links; per-document and per-project access grants; a dashboard and activity feed built from the same permission resolution as everything else; full mobile access via the Inaya app; and, as of September 2026, an OS Home screen — real-time trust & health status, cross-module notifications, one search across every module, and an AI assistant that answers both business and security questions in a single conversation. Also as of September 2026: real OAuth connections to nine external business tools, a spoken-voice mode for the AI Assistant, and a usability pass across the whole workspace — a real shared component system, accessible form labels everywhere, and three navigation bugs fixed, with zero change to any permission or backend behavior underneath. As of October 2026: a flag-gated Secure Collaboration suite (end-to-end encrypted chat and notes, controlled sharing, governance, device control) and a Device Protection suite (a hybrid post-quantum key-establishment layer, a local-only Cleaner, and Inaya Meet private video calls) — both off by default per organization.

SECTION 04

Why Zero-Knowledge Architecture Matters Here

Business Workspace inherits the same client-side encryption model as Inaya's core storage layer — a business document is encrypted in the browser before it ever leaves the user's device.

- A breach of Inaya's storage backend reveals nothing usable — an attacker gets encrypted fragments, not documents.
- Inaya cannot comply with a data request it structurally cannot fulfill — there is no key on Inaya's side to hand over.
- The permission-aware AI Assistant means even Inaya's own AI layer never sees a document outside what the requesting user is already authorized to view.

> **Positioning:** This is the product's core differentiator against traditional business collaboration SaaS — competitors encrypt data on their servers with keys they control; Business Workspace encrypts it before it arrives.

SECTION 05

Pricing & Plans

Three self-serve checkout tiers — Starter, Professional, and Business — priced monthly or annually (17% discount on annual billing), each with a 14-day free trial. Enterprise is shown at a published reference price below but is contact-sales only, not self-serve checkout.

PLAN	PRICE	USERS	STORAGE	MAX FILE SIZE
Starter	$7.99/mo · $79/yr	2	250 GB	5 GB
Professional (Most Popular)	$28/mo · $280/yr	5	1 TB	10 GB
Business	$49.99/mo · $499/yr	10	5 TB	25 GB
Enterprise	$799/mo · $7,990/yr	Up to 25	10 TB	100 GB

Add-ons available on every plan:

- Additional users — starting at $2.49/user/month
- Additional storage — $3.99/TB/month
- Beyond Enterprise's own listed capacity (25+ users or 10+ TB) — fully custom pricing via direct sales engagement

SECTION 06

Revenue Model

- Recurring subscription revenue. Monthly or annual per-company billing across four tiers, collected via Stripe.
- Seat and storage expansion revenue. Companies that outgrow their tier's limits pay incrementally for additional users or storage rather than being forced into a full tier jump.
- Enterprise contracts. Larger organizations (25+ users or 10+ TB) are handled as direct sales engagements with custom pricing, not self-serve checkout.
- Shared infrastructure economics. Business Workspace runs on the same encrypted storage backend as Inaya's core DePIN product — SaaS subscription revenue and DePIN storage/staking revenue draw on shared infrastructure investment rather than requiring a separate cost base.

SECTION 07

Market Positioning

Business Workspace competes in the business collaboration and document management category — the space occupied by mainstream cloud productivity suites and document platforms — on a specific, structural axis: who actually holds the encryption key.

- Most incumbent platforms in this category encrypt customer data with provider-managed keys — meaning the provider retains the technical ability to access customer data.
- Business Workspace encrypts client-side before data ever reaches a server, so Inaya never holds a decryption-capable key for any customer's documents.
- This isn't positioned as a replacement for full enterprise-suite platforms (email, calendaring, spreadsheets) — it's positioned specifically for the document storage, workflow, and permissioning layer, where the zero-knowledge guarantee matters most.

> **Note:** This document intentionally avoids citing specific competitors' current pricing — third-party pricing changes independently of this document and should be verified directly against each provider's current published rates before use in any external-facing material.

SECTION 08

Go-to-Market

- Product-led growth. The 14-day free trial on every self-serve tier lets a company's own owner/admin activate and evaluate the product directly, without a sales conversation.
- Cross-promotion from the existing DePIN dApp. Wallet-connected users of Inaya's core network are shown Business Workspace directly inside the dApp, converting an already-engaged audience into a second product line.
- Regional partnership channel. A distribution relationship with a regional technology consultancy is in active development, including introductions to their existing enterprise client base — consistent with the channel strategy already outlined in the GTM Strategy document.
- Primary target segments: Web3 builders, AI startups, SaaS companies, healthcare technology, financial technology, legal technology, managed service providers (as direct multi-tenant buyers, not just distribution partners, via Identity Integration's MSP support), and any organization whose documents carry real confidentiality requirements.

SECTION 09

Illustrative Unit Economics

> **Illustrative only — not a forecast:** The figures below are simple arithmetic on the published pricing in Section 05, shown to illustrate how the pricing tiers translate into recurring revenue at different levels of adoption. They are not a projection, do not assume any particular growth rate or timeline, and are independent of the Investment Memorandum's financial projections.

SCENARIO	MIX	MONTHLY RECURRING REVENUE
Early traction	100 Starter	$799
Modest adoption	200 Starter + 100 Professional	$4,398
Established base	300 Starter + 200 Professional + 50 Business	$10,497
Broader base	500 Starter + 400 Professional + 150 Business + 10 Enterprise	$30,684

SECTION 10

Product Roadmap

Business Workspace ships in stages — every stage below is live today, extending it toward a full business operations platform.

1. **Secure Business Foundation — LIVE.** Company/department/project/document hierarchy, auth, and role-based access.
2. **Document Workflow — LIVE.** Draft/review/approval states with a full activity log.
3. **Enterprise Permissions & Secure Sharing — LIVE.** Per-document access grants and expiring share links.
4. **AI Business Assistant — LIVE.** A permission-aware assistant scoped to each user's real access.
5. **Business Operations — LIVE.** Projects & tasks, CRM (unified lead/customer records with a sales pipeline), procurement (purchase requests/orders with a real approval chain), and inventory (real stock movements, including purchase orders that actually move inventory on receipt).
6. **Finance & HR — LIVE (testnet demonstration layer).** Invoices, expenses, payments, and CSV financial reporting; employee records, employee documents, computed leave balances, and Department Manager administration — built on the exact same permission foundation as every earlier stage. Not regulated banking, tax filing, or payroll processing; every screen carries a visible "Testnet / Beta" badge.
7. **Institutional Trust Infrastructure — LIVE.** A public Trust Center with client-side cryptographic verification of the audit chain; cross-organization trust primitives; a scoped API-key developer platform; a merged evidence-trail view for any record.
8. **Autonomous Resilience Layer — LIVE.** Recovery capability that's automatically, continuously re-tested against real infrastructure using synthetic canary assets — never real customer data — on a daily schedule, with a plain five-state dashboard.
9. **Four New Business Primitives — LIVE.** Inaya Sign (document signing with document/version-bound signatures and an optional on-chain completion anchor), DePIN Storage Manager (an org's own storage-node control plane), Milestone Escrow (an approval-gated, timelocked release workflow), and Financial Attestation (a cryptographic hash-commitment proof over real financial data).
10. **Business Intelligence — LIVE.** KPI cards, period-over-period comparison, and business alerts computed from the same permission-scoped data every other module reads, plus trend charts on web (mobile has KPIs/alerts, trend charts not yet ported).
11. **AI-Powered Business Operations — LIVE (guided, not autonomous).** A real LLM-backed assistant that walks a user through a multi-step task one real step at a time — advancing only on real proof the step was completed, never on its own say-so, and with no path to creating a business record on its own. Any actual mutation it proposes still requires human approval and a built-in delay before it executes.
12. **Secure Collaboration Suite — LIVE (flag-gated).** End-to-end encrypted Secure Chat (MLS/RFC 9420) and Secure Notes; Sharing 2.0 (expiring/password-protected/watermarked links, file requests); Governance (classification, DLP, retention, legal hold); device trust/block/revoke; and a Sovereign Gateway agent for on-premises file servers. Off by default per organization; the chat library has not had an independent security audit.

13. **Device Protection & Post-Quantum Key Establishment — LIVE (flag-gated).** A hybrid key-establishment layer combining the existing classical X25519 exchange with ML-KEM-768 (additive, not a replacement of classical crypto); a local-only Cleaner that never uploads a file inventory; and Inaya Meet, private peer-to-peer video calls with a conservative default room size rather than a scalable SFU. Backup, sync, Cleaner, and device status are now one consolidated view.

14. **Identity Integration & MSP Multi-Tenancy — LIVE.** Microsoft Entra ID and on-premises Active Directory sign-in, SCIM user provisioning, a Rewst automation connector, and multi-tenant management for managed service providers, verified against a real Entra tenant and a real Windows Server AD domain controller.

15. **AI Bookkeeper — LIVE.** AI-assisted transaction categorization, reconciliation, and reporting on top of the existing Finance & HR layer, with every suggested entry reviewed and confirmed by a person before it posts.

16. **Managed Database, Document Intelligence & AI/ML Studio — LIVE.** A provisioned PostgreSQL database managed from inside the Business Workspace, a document-understanding studio for invoices, purchase orders, receipts and contracts, and an AI workbench for data cataloguing, model registration, and running one governed script at a time in an isolated, disposable sandbox.

17. **Sovereign Infrastructure — LIVE.** Bring-your-own-hardware compute: a customer connects their own server and runs real virtual machines, block storage, and private networking on it, with a working subset of AWS CLI compatibility, a real HAProxy load balancer, and real Kubernetes (k3s) on guest VMs this stage creates. A structurally distinct revenue line from the SaaS seat/storage tiers above — the customer's own hardware, managed through Business Workspace.

SECTION 11

Conclusion

Business Workspace turns Inaya's core zero-knowledge storage infrastructure into a second, independent revenue engine — recurring SaaS subscriptions from companies, rather than storage fees from individual users and node operators. The product is built, live, and priced today, not a roadmap promise.

The two engines share infrastructure but serve different buyers and different revenue mechanics, giving Inaya Network two distinct paths to growth from a single underlying technology investment.
