STRATEGIC BUSINESS MODEL

DePIN Disruption Architecture

Enterprise-grade sovereign storage at Web2-commodity pricing.

Document INAYA-EXEC-2026-V2 · Classification Confidential · October 2026

SECTION 01

Executive Overview

THE MARKET FRICTION

Traditional cloud enforces unpredictable pricing, volatile egress fees, and opaque storage policies.

THE INAYA SOLUTION

A DePIN infrastructure offering sovereign data control, client-side encryption, and binary sharding anchored on BNB Chain.

> Retaining pure stablecoin payment simplicity for consumer onboarding, while structurally driving token demand and ecosystem liquidity.

SECTION 02

Pay-As-You-Go Pricing

- Billed in stablecoin (USDT), no multi-token friction for developers and retail users.
- Storage is 6.49 USDT per TB per month (about 0.0063 USDT/GB), set on the deployed contracts. A one-time upload fee equals one month of storage, and a flat account fee of 12 USDT a year applies.
- Retrieval up to the customer's stored volume is included every month. Beyond that, a fee of 10 $INAYA per 0.5 TB applies from mainnet, not before.
- Staking $INAYA unlocks priority bandwidth routing.

PROVIDER	STORAGE (1 TB / MONTH)	EGRESS (1 TB)	MINIMUMS
Amazon S3 (Standard)	~23.00 USDT	~90 USDT	None
Google Cloud Storage	~20.00 USDT	~120 USDT	None
Cloudflare R2	15.00 USDT	Free	None
Wasabi	~7.99 USDT	Free within limits	1 TB, 90 days
Storj	7.00 USDT	7 USDT	5 USDT / month
Backblaze B2	6.95 USDT	Free to 3x stored, then 10 USDT	None
Inaya Network (DePIN)	6.49 USDT	Included to 1x stored, then $INAYA fee at mainnet	None

Competitor figures are list prices in USD as of November 2026: Backblaze B2, Storj and Cloudflare R2 are from their own pricing pages; figures marked ~ are widely reported list prices. Inaya's figures are the values set on the deployed contracts.

Pricing headroom. Inaya's pay-as-you-go rate moved from 4.50 to 6.49 USDT per TB per month in November 2026 and is still the lowest list price in this table: about 7% under Backblaze B2 and Storj, 19% under Wasabi, 57% under Cloudflare R2 and 72% under Amazon S3. Storj's current prices took effect on 1 July 2026, and Backblaze and Wasabi are also reported to have raised prices during 2026. Prices are owner-settable on the deployed contracts, so they can be reviewed as the market moves.

SECTION 03

Corporate Reserve Plans (Annual)

ALLOCATION	INAYA FEE (USDT/YR)	PER TB PER MONTH	ANNUAL MAINTENANCE
250 TB / Year	17,970	5.99 USDT	500 USDT-eq.
500 TB / Year	34,740	5.79 USDT	1,000 USDT-eq.
1000 TB / Year	65,880	5.49 USDT	2,000 USDT-eq.

This is the real, live tier structure in the dApp's Business Model tab and checkout flow. Larger allocations carry a volume discount off the 6.49 USDT pay-as-you-go rate.

SECTION 04

Revenue Flow

1. **1. Customer pays.** A corporate or retail customer settles a storage invoice in USDT.
2. **2. Router processes.** RevenueRouter.processCorporateInvoice() executes on-chain.
3. **3. Escrow funds operators.** A separate client-initiated transaction calls InayaCorporateEscrow.createEscrow(), locking the node-operator COGS share for a 12-month, monthly-release vesting schedule.

ALLOCATION	PURPOSE
35%	Node Reward Escrow
55%	Company Treasury
10%	Team & Platform Operations

How the split works. Payment and escrow are two separate transactions started from the customer's checkout, not one automatic on-chain cascade. The 35% node-operator share is a fixed value in the production payment code, not an estimate. The remaining 65% splits 55% to the company treasury and 10% to team and platform operations, which matches the protocol's EBITDA math (65% gross margin − 3% grants − 5% R&D − 2% admin, legal and marketing = 55%). At 6.49 USDT per TB per month, node operators receive about 2.27 USDT and Inaya retains about 4.22 USDT per TB per month.

SECTION 05

The Staking Flywheel

STAKING MULTIPLIER LOOP

Node operators locking earned rewards back into staking generate a secondary passive income stream instead of immediately liquidating.

REDUCED SELL PRESSURE

As operators favor accumulation over liquidation, circulating supply available for sale drops, while egress fees, once they activate at mainnet, create ongoing demand that absorbs it.

> Real, implemented mechanic: InayaStaking offers 0/30/90-day lock tiers at 1.00x/1.25x/1.50x reward multipliers, enforced on-chain via a real withdrawal lock, not just a UI label.

SECTION 06

Token Allocation

SECTOR	%	TOKENS
Swarm Reserve (Nodes)	40.0%	12,000,000 INAYA
Staking Rewards Pool	26.7%	8,000,000 INAYA
Liquidity Pool	21.7%	6,500,000 INAYA
Team Runway	5.0%	1,500,000 INAYA
Core Ecosystem Fund	3.3%	1,000,000 INAYA

Fixed 30,000,000 total supply, consistently published across every prior team document. The five allocations above sum to 29,000,000 tokens (96.7% of total supply); the remaining 1,000,000 INAYA (3.3%) is held unallocated pending a future allocation decision, not yet assigned to a named sector.

SECTION 07

Foundation Scholarship

- Total commitment: 3% of protocol revenue — 54,000 USDT annually under the illustrative 1,800,000 USDT gross-inflow scenario the team has previously modeled (a mix of Corporate Reserve tier sales plus PAYG volume; 3% × 1,800,000 = 54,000).
- Non-dilutive, objective-focused micro-grants for young developers, cryptography students, and independent open-source builders using the Inaya Custody SDK.
- Not yet accepting applications as of this writing — planned to open after mainnet launch.

SECTION 08

Beyond Storage — The Full Ecosystem

This deck covers the core storage/DePIN economics specifically. Inaya has since grown a full application layer on the same infrastructure — Business Workspace (a genuinely independent SaaS revenue line, now including real business operations and a Finance & HR layer), the Security Layer, an Oracle & Automation Layer, Inaya Learn, an Investor Data Room, two desktop apps, four AI assistants, a Sovereign Enterprise OS layer connecting all of it, and — as of September 2026 — a public Trust Center, an Autonomous Resilience Layer, a Node Operator Dashboard, four new business primitives (Inaya Sign, DePIN Storage Manager, Milestone Escrow, Financial Attestation), Identity Integration with MSP multi-tenancy, an AI Bookkeeper, and a Managed Database/Document Intelligence/AI-ML Studio — and, as of October 2026, six industry editions of Business Workspace (Health, Legal, Regulated Enterprise, Financial, Government and Education) with an optional ERP-style layout.

Enterprise interoperability, September 2026. The storage layer itself now speaks the two protocols enterprise IT already standardizes on: a real, tested AWS S3-compatible API and Azure Blob Storage-compatible API (verified against the actual AWS CLI and the official Azure SDK — not a simplified approximation). On top of that sits an enterprise storage governance suite: scoped, time-limited access credentials; object version history with one-click restore; immutable locked retention for compliance; legal hold; automated lifecycle/retention policies; and a native desktop drive mount so storage appears as an ordinary drive letter. This closes the single largest objection enterprise storage buyers raise — migration cost — since existing tools and scripts connect with no rewrite.

Secure Collaboration & Device Protection, October 2026. Two further additions to Business Workspace, both off by default per organization: a Filen/FileCloud-inspired Secure Collaboration suite (end-to-end encrypted Secure Chat and Secure Notes, Sharing 2.0, Governance, device control, a Sovereign Gateway agent for on-premises file servers), and an Internxt-inspired Device Protection suite (a hybrid post-quantum key-establishment layer combining classical X25519 with ML-KEM-768, a local-only Cleaner, and Inaya Meet private peer-to-peer video calls). Neither changes the storage/DePIN revenue mechanics described above.

Sovereign Infrastructure, October 2026. A third addition, structurally distinct from the storage/DePIN protocol above: a customer can now connect their own server and run real virtual machines, block storage, and private networking on it, managed from the Business Workspace, with a working subset of AWS CLI compatibility, a real HAProxy load balancer, and real Kubernetes (k3s) on guest VMs this stage creates. This is customer-owned hardware — it does not route through the storage network's node-reward economics described elsewhere in this document.

See the companion "Complete Ecosystem Architecture" and "SaaS Business Model" documents for full detail on the application layer's own economics.

SECTION 09

Leadership

Talha Waqas — Founder & CTO

Web3 full-stack engineer specializing in client-side cryptographic infrastructure and secure data-routing pipelines.

Yakub Adnan — Co-Founder & Growth Lead

Drives growth architecture, community operations, and campaign distribution across the ecosystem.

Fibha Urooj — CFO

Leads financial planning, budgeting, compliance, and operational finance.
