Inaya Network *General User & Community* FAQs

A FRIENDLY GUIDE FOR EVERYDAY USERS & BUILDERS

INAYA NETWORK — DEPIN INFRASTRUCTURE & CUSTODY PROTOCOL

Q1

What is Inaya Network in simple terms?

Think of Inaya Network as the ultimate, unhackable digital vault for your most sensitive files — things like identity documents, private keys, or digital assets. Unlike Google Drive or Dropbox, which store your files whole on central corporate servers, Inaya breaks your data into pieces and scatters them across a decentralized network. That means no single company, hacker, or even Inaya itself, can ever peek into your private files.

Q2

How does the "file slicing" feature actually protect me?

The magic happens entirely inside your own browser before anything is uploaded. When you upload a file, Inaya immediately encrypts it and cuts it right down the middle into two separate pieces: Shard Alpha and Shard Beta.

These pieces are sent to completely different, secure decentralized storage networks. Even if a hacker somehow manages to compromise one network, all they will find is random binary noise. Your file can only be put back together when you log in with your private master passkey.

Q3

Do I need to pay a monthly corporate subscription to use Inaya?

Not at all! The expensive monthly subscriptions are strictly for big companies and enterprise platforms that automate millions of database requests. For everyday normal users and independent creators, Inaya features a transparent **Pay-As-You-Go** model. You only pay for the exact amount of data storage you actually consume, with zero monthly commitments.

Q4

Exactly how much does it cost to store data on Inaya?

To keep pricing completely stable and independent of crypto market crashes, our baseline rate is pegged at exactly **0.1 USDT + 0.1 INAYA per Gigabyte (GB)** of data. The tiny USDT fraction covers the physical node network handling your file, while the small amount of our native token (\$INAYA) makes sure the network stays active, fast, and healthy.

Q5

What crypto wallets are supported by the platform?

Inaya is built natively on top of the high-speed BNB Chain ecosystem. You can easily connect and authenticate your identity using standard, secure Web3 browser extension wallets like MetaMask, or any other wallet supported by your dApp interface. There are no usernames or passwords stored on our end; your wallet is your universal key.

Q6

I am a student / young developer. How can I get a grant from Inaya?

We love backing our open-source building community! Through The Inaya Foundation Scholarship & Grant Project, we distribute equity-free micro-grants ranging from **\$2,500 to \$10,000** to young developers and cryptography students.

The only condition is that you must use this free funding to build an app, website, or tool that integrates the Inaya Custody SDK. You can apply directly through our website's grant portal.
