

OFFICIAL COMPANY PROFILE

Inaya Network

"Re-establishing Absolute Client-Side Data Sovereignty"

Industry Domain Web3 Infrastructure & DePIN
Deployment Framework BNB Chain Ecosystem (EVM Native)

Document Type Corporate Profile
Classification Public

SECTION 01

Executive Summary

Balancing zero-knowledge privacy parameters with public blockchain immutability, the network delivers a resilient, autonomous, and secure framework for the modern decentralized web.

Inaya Network is a next-generation Decentralized Physical Infrastructure Network (DePIN) engineered to eliminate the institutional vulnerabilities, data monopolies, and security risks inherent in legacy centralized cloud architectures (e.g., Amazon AWS, Google Cloud).

By removing administrative backend control from the intermediary layer, Inaya Network grants edge-node operators and individual users absolute client-side sovereignty over their high-value digital assets.

INDUSTRY	FOCUS	CHAIN
Web3 Infrastructure / DePIN	Cryptographic Data Custody	BNB Chain (EVM Native)

SECTION 02

Core Technological Architecture

The structural foundation of Inaya Network bypasses centralized relational databases entirely, operating across three distinct cryptographic layers:

- 01

Hardened Client-Side Encryption

Data objects are encrypted locally at the browser layer using advanced PBKDF2 parameters and AES-GCM verification models prior to network transit. Plaintext files never traverse the network intact.
- 02

Cryptographic Sharding Protocol

Following local encryption, files are dynamically divided through isolated network pipelines into distinct Alpha and Beta shards (secure fragments) and distributed across independent decentralized node clusters.
- 03

Public EVM Ledger Anchoring

The tracking metadata hashes of these distributed fragments are permanently anchored to smart contract registers on the BNB Chain, ensuring a 99.999% sync confidence interval and immutable transactional lineage tracking.

2.1 Value Proposition & Market Positioning

Inaya Network transcends traditional cloud storage utilities by serving as a robust infrastructure layer for institutional compliance data, enterprise-grade privacy protocols, and high-security Web3 decentralized applications (dApps).

Mechanically hardened against Sybil attacks, proprietary backend filters intercept and isolate malicious node clusters or automated scripts from ecosystem rewards tracking loops, preserving an organic, fair, and meritocratic incentive model for legitimate network contributors.

SECTION 03

Executive Leadership & Founder Matrix

Talha Waqas

FOUNDER & CTO

Core System Architect, Smart Contract Architect & Lead Web3 Full-Stack Engineer

PROFESSIONAL EXPERTISE

Deep industrial specialization in browser-layer cryptographic engineering, EVM smart contract logic architecture, zero-knowledge storage protocols, and complex node telemetry networks. Piloting the technical execution of decentralized storage kernels, automated gas estimation pipelines, and public ledger sync operations. Responsible for driving core codebase development, technical compliance documentation, and security parameter optimization for the Inaya core stack.

Fibha Urooj

CO-FOUNDER & CMO

Corporate Operations Director, Head of Ecosystem Growth & Lead User Acquisition Strategist

PROFESSIONAL EXPERTISE

Advanced structural proficiency in commercial finance parameters, asset tracking analysis (B.Com foundation), and pedagogical crowd coordination frameworks (teaching & educational management background). Strategically leveraging educational design skills to convert browser-layer cryptography details into simplified, mass-market user onboarding pipelines. Directly manages international alpha testing recruitment, scalable ecosystem marketing funnels, decentralized rewards accounting matrices (Zealy / QuestN system synchronization), and cross-regional tester education channels to maximize network growth metrics.

SECTION 04

Strategic Swarm Roadmap

- 

PHASE 01
Deployment & Audit Proof

Launching EVM validation contracts across Binance scaling protocols, integrating dynamic block-range scanning algorithms, and conducting rigorous penetration security testing.
- 

PHASE 02
Incentivized Alpha & Sybil Block

Deploying the global anti-sybil validation portal, verifying edge-node hardware identities, and initializing active transaction-tracking testing pipelines.
- 

PHASE 03
TGE & Cross-Chain Expansion

Executing the official Token Generation Event (TGE) for \$INAYA token allocations, launching smart cross-chain network bridges, and aggregating client file fragment storage servers globally.

"Absolute Protection, Vigilant Care, and Functional Grace — the guiding principles of a network built to guard what matters most."
