CORPORATE PROFILE

Inaya Network

Re-establishing absolute client-side data sovereignty — Web3 infrastructure and DePIN, built on BNB Chain.

Document INAYA-PROFILE-2026-V2 · Classification Public · October 2026

SECTION 01

Executive Summary

Inaya Network is a next-generation Decentralized Physical Infrastructure Network (DePIN) built to eliminate the vendor lock-in, data monopolies, and single-point-of-failure risk inherent in legacy centralized cloud storage.

INDUSTRY	FOCUS	CHAIN
Web3 Infrastructure / DePIN	Cryptographic Data Custody	BNB Chain Testnet (EVM-native)

SECTION 02

Core Technology

1. **Client-side encryption.** Every file is encrypted locally (AES-GCM-256, PBKDF2 key derivation) before it ever leaves the device. Plaintext never traverses the network.
2. **Binary sharding.** The encrypted file is split into two independent halves, distributed to independent storage nodes — neither half is meaningful alone.
3. **On-chain ownership anchoring.** A tamper-evident ownership record — never the file itself — is written to a BNB Chain smart contract, permanent by design.

SECTION 03

Product Ecosystem

What began as a storage protocol has grown into a full product ecosystem, spanning consumer, developer, and enterprise surfaces — all on the same underlying infrastructure.

- Web dApp — faucet, encrypted vault upload/download, staking, referrals, and a live Corporate Reserve purchase flow.
- Business Workspace — a standalone B2B SaaS product (organizations, departments, projects, documents, workflow, permissions, billing) plus real business operations (Tasks, CRM, Procurement, Inventory) and a Finance & HR layer (invoices, expenses, employee records, leave management), web and mobile.
- Security Layer ("Inaya Firewall") — decentralized, node-reported threat intelligence with on-chain-confirmed verdicts, surfaced publicly, on mobile, and enforced at the OS level on desktop.
- Inaya Learn — an educational video platform with an AI tutor, on web and mobile.
- Investor Data Room — access-controlled document sharing with per-visitor engagement analytics.
- Mobile app — a full superset of the web dApp's features, plus Business Workspace, Learn, and Security.
- Two native desktop apps (Windows + Linux) — one for the Business Workspace, one for the main dApp.
- Developer SDK & CLI — the custody-sdk client library plus a published node-operator daemon.
- Four purpose-built AI assistants (Docs, Business, Security, Learn) — Gemini-powered, each with a guardrail philosophy suited to its job; Docs, Security, and Learn are grounded by a shared RAG (retrieval-augmented generation) layer over a real, re-ingestable content index on MongoDB Atlas.
- Oracle & Automation Layer — an on-chain data registry and a self-operating keeper that executes pre-approved contract actions automatically, live on BSC Testnet.
- Sovereign Enterprise OS — the connecting layer across all of the above: unified identity, notifications, search, a real trust & health signal, and one AI assistant spanning business and security questions, on both web and Business Workspace.
- Institutional Trust Infrastructure & Autonomous Resilience — a public Trust Center with client-side cryptographic verification, cross-org trust primitives, a scoped API-key developer platform, and daily automated recovery testing against real infrastructure.
- A Node Operator Dashboard, four new business primitives (Inaya Sign, DePIN Storage Manager, Milestone Escrow, Financial Attestation), real OAuth for nine external business tools, and a spoken-voice AI Assistant mode.
- Mainframe & Legacy Data Access — connect a relational data source once, publish chosen tables, and query them live with standard SQL, a real JDBC driver, and a real compiled ODBC driver, read-only and fully audited.
- Sovereign NAS — a managed on-premises SMB/NFS file server (Windows, Mac and Linux clients) with RAID pools, snapshots, WORM immutability, automatic ransomware lockdown, and verified backup, tested end to end on a real Linux appliance.
- AI Security Workflow — one gateway in front of every text AI assistant that detects prompt injection and personal data, applies per-organization policy, and records every decision, with a real blocked attack verified live.
- Document & Invoice Automation — nine document types generated from real Finance/CRM/Procurement records, numbered, exactly calculated, approved, encrypted, delivered and independently verifiable; live-confirmed in English, Arabic and Urdu.

- AI Business Operations Manager (Automations) — a visual workflow builder with an AI operations manager, human approval, and evidence for every run; Slack and Gmail delivery verified live from production.
- Customer Portal & Customer Service — tickets, a customer portal with SLAs and a knowledge base, an AI helper, and Help & Support so Inaya's own users can reach Inaya's team directly, with an email copy to support@inayanetwork.com.
- Identity Integration — Microsoft Entra, Active Directory, SCIM, Rewst and MSP support with joiner/mover/leaver lifecycle and six independently verified revocation steps, proven against a real Entra tenant.
- AI Bookkeeper — reads bank statements, bills and receipts, matches and reconciles them with full provenance, and sends anything uncertain or risky to a person; no posting happens without a human, and no ledger was invented.
- An independent, ongoing whole-codebase quality and security review — a critical bridge signing flaw, a double-settlement risk, and a production PDF-rendering defect were each found, fixed and locked in with a regression test.
- Managed Database, Document Intelligence & AI/ML Studio — a real, provisioned PostgreSQL database, a general document-understanding studio for any document type (not just invoices), and an AI workbench for data cataloguing, quality checks, model registry, and one governed piece of code run at a time in a real, disposable, network-off-by-default sandbox — 26 real tests passing, including live runs against a real cloud sandbox.
- Secure Collaboration — end-to-end encrypted Secure Chat (MLS/RFC 9420) and Secure Notes, Sharing 2.0 (expiring/password-protected/watermarked links, file requests), enterprise Governance (classification, DLP, retention, legal hold), device control, and a Sovereign Gateway agent for on-premises file servers — off by default per organization, Filen/FileCloud-inspired.
- Device Protection — a hybrid post-quantum key-establishment layer (classical X25519 combined with ML-KEM-768), Inaya Cleaner (a local-only desktop duplicate/junk-file scanner, trash rather than permanent delete), and Inaya Meet (private peer-to-peer video calls reusing Secure Chat), consolidated with the existing backup/sync/device screens into one view — Internxt-inspired, hybrid and local-first by design, not a mainnet or fully-audited claim.
- Vertical Sovereign OS products — purpose-built editions of the same Business Workspace foundation for Healthcare & Legal, Financial Services & Regulated Enterprise, and Government & Public Sector customers, each adding the compliance workflows and record types that vertical actually needs rather than a generic one-size-fits-all SaaS layer.
- Sovereign Infrastructure — bring-your-own-hardware compute: a customer connects their own server and runs real virtual machines, block storage, and private networking on it from the Business Workspace, with a working subset of AWS CLI compatibility, a real HAProxy load balancer, and real Kubernetes (k3s) on guest VMs this stage creates — each verified against real hardware. GPU passthrough, full AWS coverage, and TPM-backed execution remain explicitly out of scope today.
- Appointments & Email Marketing — a public booking page with team calendars, email reminders, Google/Outlook sync without a paid API, and CRM logging of every meeting; plus approved email campaigns and follow-up sequences to CRM segments with one-click unsubscribe and automatic suppression of bounces and complaints.

SECTION 04

Leadership

Talha Waqas — Founder & CTO

Core system architect and lead full-stack engineer. Deep specialization in browser-layer cryptographic engineering, EVM smart contract design, zero-knowledge storage protocols, and node telemetry systems — driving core codebase development end to end.

Yakub Adnan — Co-Founder & Growth Lead

Web3 growth operator and community strategist. Specializes in DePIN, user acquisition, and AI-driven ecosystem scaling — leads growth architecture, community operations, and campaign distribution, bridging complex protocol features with on-chain adoption.

Fibha Urooj — CFO

B.Com in Accounting & Finance. Leads financial planning, budgeting, compliance, and operational finance — building the financial foundation supporting Inaya Network's long-term growth.

SECTION 05

Roadmap

1. **Phase 01 — Deployment & Audit Proof.** EVM contract deployment across BNB Chain scaling infrastructure, block-range scanning, and third-party security audits ahead of mainnet.
2. **Phase 02 — Incentivized Alpha & Sybil Resistance.** Anti-sybil validation for edge-node operators, hardware identity verification, and active transaction-tracking pipelines.
3. **Phase 03 — TGE & Cross-Chain Expansion.** Token Generation Event for $INAYA, cross-chain bridge deployment, and global expansion of the storage node network.

These three phases remain the core protocol-layer roadmap. The application layer (Section 03) — Business Workspace, Security Layer, Inaya Learn, and the Investor Data Room — has since grown into a significant, independently-scoped body of work alongside it, tracked on its own roadmap rather than folded into these three phases. That application-layer roadmap now includes a 13th stage, Storage Interoperability & Inaya Drive — real AWS S3/Azure Blob/Google Cloud Storage protocol compatibility, a real mounted Inaya Drive on Windows and Linux, a local data migration tool, and a compliance evidence exporter, all live and tested; a 14th stage, Evidence Graph & Digital Twin, connecting business records into one traceable, cryptographically-provable story with a read-only "What If?" simulator; and a 15th stage, the Modular Enterprise Adoption Layer — DirectSync automatic local-folder backup, Data Room Templates, a recurring Cloud Backup & Health Scheduler, and the What-If Scenario Studio's own front-end; and a 16th stage, the Storage Control Plane & Terraform Provider — an IBM Cloud VPC Storage-inspired volume/file-share registry, a real point-in-time snapshot engine, automated backup policies, and a real Terraform provider so an IT team can manage all of it as code; and a 17th stage, the Official Documentation Platform — a real IBM Cloud Docs-inspired portal live at inayanetwork.com/docs, with product guides, a hand-verified API/SDK/CLI reference, search, release notes, and a downloadable OpenAPI spec — all live and tested (see inayanetwork.com/business/roadmap). Eight more stages followed in the same month: Sovereign NAS, AI Security Workflow, Document & Invoice Automation, AI Business Operations Manager (Automations), Customer Portal & Customer Service, Identity Integration, AI Bookkeeper, and Mainframe & Legacy Data Access — each live, tested, and honestly labelled for what is proven against a real outside system versus what is not — plus an ongoing whole-codebase quality and security review that has already found and fixed a critical cross-chain signing flaw, a payment double-settlement risk, and a production PDF-rendering defect. A ninth stage followed directly after: a real managed PostgreSQL database service (provision/start/stop/backup/restore-to-a-point-in-time through a real external provider, since Inaya's own serverless infrastructure cannot host a database engine itself), a general Document Intelligence Studio (built-in and custom document readers with versioned human corrections, confidence and grounding on every field), and an AI/ML Studio governance layer (data catalogue, data-quality checks, model registry, named-metric evaluations, and a governed one-snippet-at-a-time code sandbox — deliberately not a persistent notebook) — 26 real tests passing throughout, including live runs against a real, disposable cloud sandbox created and destroyed for each one (see inayanetwork.com/business/roadmap and docs/sqa/master-defect-registry.md).
